

SEO audit checklist

Start with important pages and representative templates. For each issue, record an example URL, evidence and acceptance criteria for the fix.

Crawling and indexing

- ☐ Important pages are available and return the expected HTTP status.
- ☐ robots.txt and noindex do not accidentally block required content.
- ☐ The sitemap contains current canonical URLs without errors or redirects.

Structure and intent

- ☐ Queries are mapped to pages and real user needs.
- ☐ Duplicate pages are identified; consolidation or distinctions are justified.
- ☐ City pages offer useful differences rather than just a substituted name.

Content

- ☐ Title, main heading and description explain the page clearly.
- ☐ Content answers the task with examples and verifiable sources.
- ☐ Outdated prices, terms, contacts and unsupported claims are corrected.

SEO audit checklist

Continue the review. Resolve critical issues before launch or expanding the work.

Links and technical review

- ☐ Important pages are linked through navigation; orphan pages are reviewed.
- ☐ No broken internal links or unnecessary redirect chains remain.
- ☐ Canonicals and language relationships fit the actual site structure.

Mobile journey and usability

- ☐ No horizontal overflow; text, menus and forms work on a phone.
- ☐ Images are appropriately sized; loading does not obstruct the key action.
- ☐ Forms, keyboard focus and control labels are verified.

Measurement and planning

- ☐ Baseline clicks, impressions and leads include periods and segments.
- ☐ Tasks are ranked by impact and effort, with owners and due dates.
- ☐ Reporting accounts for seasonality, releases and data limitations.

Blocking issue and owner
